

Abstract

This particularly flat and low pourer-closure for composite packs or container openings, which are closed with a thick foil, comprise a bottom part (1), which, with the bottom side of its base plate (9), is intended to be welded on a composite pack or thick foil. The base plate (9) has a drain opening (34) and also projections (6,7,8), which jut upwards and surround the base plate. A cover (2) is formed, which swivels on a hinge (3) towards the bottom part (1) and can be swiveled down tightly on the bottom part as a collar (23), which runs all round over the bottom side of the cover (2), matches with the projection (6,7,8) on the bottom part (1). In the internal drain opening (34) on the base plate (9), a break off plate (13), with its outer edge following the inner edge (12) of the drain opening (34), is formed through at least two material bridges (32) as breaking points. The bottom side of this break off plate (13) runs flush with the bottom side of the base plate (9) and is welded on a thick foil on a composite pack, which covers a perforated hole there. When the break off plate (13) is broken off, the welded piece is torn off from the thick foil and the composite pack is thus opened.
